

29C16 AND 29C17

16 PIN CHMOS SINGLE-CHIP PCM CODEC AND FILTER

■ 29C16 μ -Law, 2.048 MHz Master Clock

■ 29C17 A-Law, 2.048 MHz Master Clock

■ Low-Power Pin Compatible Version of Intel's 2916 and 2917

■ AT&T D3/D4 and CCITT Compatible

■ 16-Pin Package for Higher Linecard Densities

■ Ideal for Digital Handset Applications

■ 3 Low-Power Modes

— 5mW Typical Power Down

— 8mW Typical Standby

— 70mW Typical Operating

■ TTL and CMOS Compatible

■ Two Timing Modes

— 64 KHz to 2 MHz Variable

— 2 MHz Direct

Intel's 29C16 and 29C17 are CHMOS versions of Intel's NMOS 2916 and 2917 family members. CHMOS is a technology built on HMOS-II, thus realizing the high performance and density obtained in that process while achieving the low power consumption typical of CMOS circuits.

The 29C16 and 29C17 are limited feature versions of the 29C13 and 29C14. The inherent low-power and small package size make these devices ideal for digital handset and cellular telephones where small size and low power are especially desirable.

Figure 1. Pin Configuration

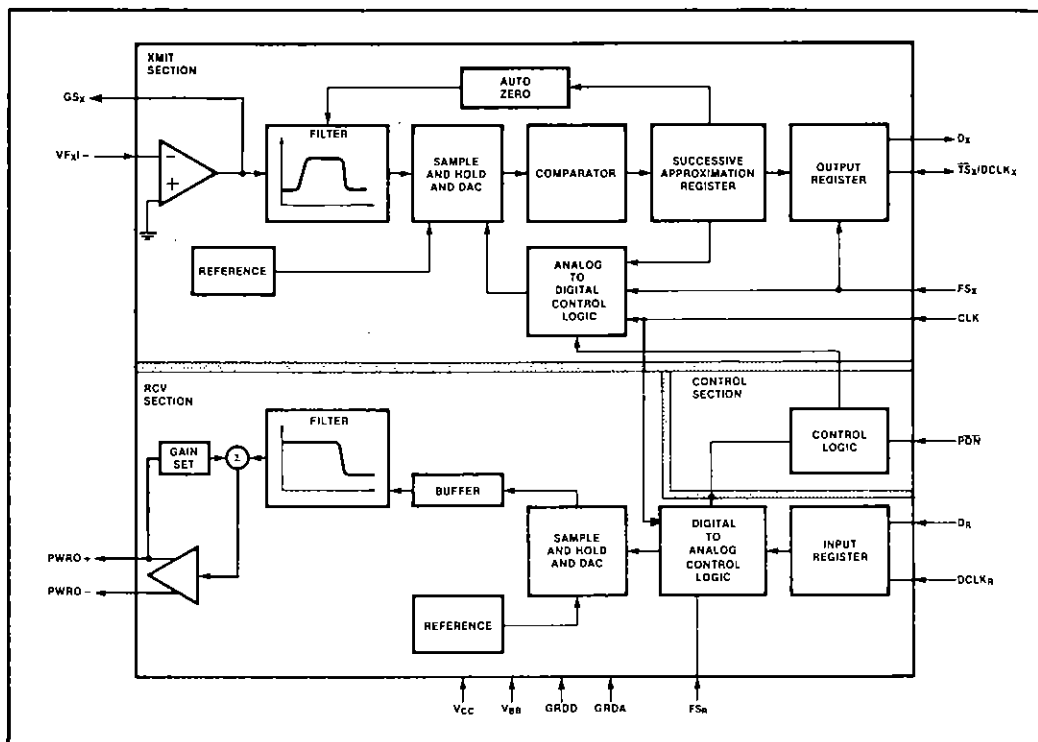

Figure 2. Block Diagram

Table 1. Pin Names

V _{BB}	Power (−5V)	GS _x	Transmit Gain Control
PWRO+, PWRO−	Power Amplifier Outputs	VF _{xI} −	Analog Input
PDN	Power Down Select	GRDA	Analog Ground
DCLK _R	Receive Variable Data Clock	TS _x	Timeslot Strobe/Buffer Enable
D _R	Receive PCM Input	DCLK _x	Transmit Variable Data Clock
FS _R	Receive Frame Synchronization Clock	D _x	Transmit PCM Output
		FS _x	Transmit Frame Synchronization Clock
GRDD	Digital Ground	CLK	Master Clock
V _{CC}	Power (+5V)		

Table 2. Pin Description

Symbol	Function
V _{BB}	Most negative supply; input voltage is -5 volts \pm 5%.
PWRO+	Non-inverting output of power amplifier. Can drive transformer hybrids or high impedance loads directly in either a differential or single ended configuration.
PWRO-	Inverting output of power amplifier. Functionally identical and complementary to PWRO+.
PDN	Power down select. When PDN is TTL high, the device is active. When low, the device is powered down.
DCLK _R	Selects the fixed or variable data rate mode. When DCLK _R is connected to V _{BB} , the fixed data rate mode is selected. In this mode, the device is fully compatible with Intel 2910A and 2911A direct mode timing. When DCLK _R is not connected to V _{BB} , the device operates in the variable data rate mode. In this mode DCLK _R becomes the receive data clock which operates at TTL levels from 64Kb to 2.048 Mb data rates.
D _R	Receive PCM input. PCM data is clocked in on this lead on eight consecutive negative transitions of the receive data clock; CLK in the fixed data rate mode and DCLK _R in variable data rate mode.
FS _R	8KHz frame synchronization clock input/timeslot enable, receive channel. In variable data rate mode this signal must remain high for the entire length of the timeslot. The receive channel enters the standby state whenever FS _R is TTL low for 300 milliseconds.

Symbol	Function
GRDD	Digital ground for all internal logic circuits. Not internally tied to GRDA.
CLK	Master and data clock for the fixed data rate mode; master clock only in variable data rate mode.
FS _X	8 KHz frame synchronization clock input/timeslot enable, transmit channel. Operates independently but in an analogous manner to FS _R . The transmit channel enters the standby state whenever FS _X is TTL low for 300 milliseconds.
D _X	Transmit PCM output. PCM data is clocked out on this lead on eight consecutive positive transitions of the transmit data clock; CLK in fixed data rate mode and DCLK _X in variable data rate mode.
TS _X /DCLK _X	Transmit channel timeslot strobe (output) or data clock (input) for the transmit channel. In fixed data rate mode, this pin is an open drain output designed to be used as an enable signal for a three-state buffer as in 2910A and 2911A direct mode timing. In variable data rate mode, this pin becomes the transmit data clock which operates at TTL levels from 64Kb to 2.048 Mb data rates.
GRDA	Analog ground return for all internal voice circuits. Not internally connected to GRDD.
VF _X I-	Inverting analog input to uncommitted transmit operational amplifier.
GS _X	Output terminal of on-chip transmit channel input op amp. Internally, this is the voice signal input to the transmit filter.
V _{CC}	Most positive supply; input voltage is +5 volts \pm 5%.

FUNCTIONAL DESCRIPTION

The 29C16 and 29C17 provide the analog-to-digital and the digital-to-analog conversions and the transmit and receive filtering necessary to interface a full duplex (4 wires) voice telephone circuit with the PCM highways of a time division multiplexed (TDM) system. They are intended to be used at the analog termination of a PCM line.

The following major functions are provided:

- Bandpass filtering of the analog signals prior to encoding and after decoding
- Encoding and decoding of voice and call progress information
- Encoding and decoding of the signaling and supervision information

GENERAL OPERATION

System Reliability Features

The combochip can be powered up by pulsing FS_X and/or FS_R while a TTL high voltage is applied to \overline{PDN} , provided that all clocks and supplies are connected. The 29C16 and 29C17 have internal resets on power up (or when V_{BB} or V_{CC} are re-applied) in order to ensure validity of the digital outputs and thereby maintain integrity of the PCM highway.

On the transmit channel, digital outputs D_X and \overline{TS}_X are held in a high impedance state for approximately four frames (500 μs) after power up or application of V_{BB} or V_{CC} . After this delay, D_X and \overline{TS}_X will be functional and will occur in the proper timeslot. The analog circuits on the transmit side require approximately 60

milliseconds to reach their equilibrium value due to the autozero circuit settling time.

To enhance system reliability, \overline{TS}_X and D_X will be placed in a high impedance state approximately 30 μs after an interruption of CLK.

Power Down and Standby Modes

To minimize power consumption, two power down modes are provided in which most 29C16/C17 functions are disabled. Only the power down, clock, and frame sync buffers, which are required to power up the device, are enabled in these modes. As shown in Table 3, the digital outputs on the appropriate channels are placed in a high impedance state until the device returns to the active mode.

The Power Down mode utilizes an external control signal to the \overline{PDN} pin. In this mode, power consumption is reduced to the value shown in Table 3. The device is active when the signal is high and inactive when it is low. In the absence of any signal, the \overline{PDN} pin floats to TTL high allowing the device to remain active continuously.

The Standby mode leaves the user an option of powering either channel down separately or powering the entire device down by selectively removing FS_X and/or FS_R . With both channels in the standby state, power consumption is reduced to the value shown in Table 3. If transmit only operation is desired, FS_X should be applied to the device while FS_R is held low. Similarly, if receive only operation is desired, FS_R should be applied while FS_X is held low.

Fixed Data Rate Mode

Fixed data rate timing, which is 2910A and 2911A

Table 3. Power-Down Methods

Device Status	Power-Down Method	Typical Power Consumption	Digital Output Status
Power Down Mode	\overline{PDN} = TTL low	5 mW	\overline{TS}_X and D_X are placed in a high impedance state within 10 μs .
Standby Mode	FS_X and FS_R are TTL low	8 mW	\overline{TS}_X and D_X are placed in a high impedance state within 300 milliseconds.
Only transmit is on standby	FS_X is TTL low	50 mW	\overline{TS}_X and D_X are placed in a high impedance state within 300 milliseconds.
Only receive is on standby	FS_R is TTL low	50 mW	

compatible, is selected by connecting $DCLK_R$ to V_{BB} . It employs master clock CLK, frame synchronization clocks FS_X and FS_R , and output TS_X .

CLK serves as the master clock to operate the codec and filter sections and as the bit clock to clock the data in and out from the PCM highway. FS_X and FS_R are 8 kHz inputs which set the sampling frequency. TS_X is a timeslot strobe/buffer enable output which gates the PCM word onto the PCM highway when an external buffer is used to drive the line.

Data is transmitted on the highway at D_X on the first eight positive transitions of CLK following the rising edge of FS_X . Similarly, on the receive side, data is received on the first eight falling edges of CLK. The frequency of CLK must be 2.048 MHz. No other frequency of operation is allowed in the fixed data rate mode.

Variable Data Rate Mode

Variable data rate timing is selected by connecting $DCLK_R$ to the bit clock for the receive PCM highway rather than to V_{BB} . It employs master clock CLK, bit clocks $DCLK_R$ and $DCLK_X$, and frame synchronization clocks FS_R and FS_X .

Variable data rate timing allows for a flexible data frequency. It provides the ability to vary the frequency of the bit clocks, from 64 kHz to 2.048 MHz. The master clock is still restricted to 2.048 MHz.

In this mode, $DCLK_R$ and $DCLK_X$ become the data clocks for the receive and transmit PCM highways. While FS_X is high, PCM data from D_X is transmitted onto the highway on the next eight consecutive positive transitions of $DCLK_X$. Similarly, while FS_R is high, each PCM bit from the highway is received by D_R on the next eight consecutive negative transitions of $DCLK_R$.

On the transmit side, the PCM word will be repeated in all remaining timeslots in the 125 μ s frame as long as $DCLK_X$ is pulsed and FS_X is held high. This feature allows the PCM word to be transmitted to the PCM highway more than once per frame, if desired, and is only available in the variable data rate mode.

Precision Voltage References

No external components are required with the combochip to provide the voltage reference function. Voltage references are generated on-chip and are calibrated during the manufacturing process. These

references determine the gain and dynamic range characteristics of the device.

Separate references are supplied to the transmit and receive sections and each is trimmed independently during the manufacturing process. The reference value is then further trimmed in the gain setting op-amps to a final precision value. With this method the combochip can achieve the extremely accurate Digital Milliwatt Responses specified in the TRANSMISSION PARAMETERS, providing the user a significant margin for error in other board components.

TRANSMIT OPERATION

Transmit Filter

The input section provides gain adjustment in the passband by means of an on-chip operational amplifier. This operational amplifier has a common mode range of ± 2.17 volts, a maximum DC offset of 25 mV, and a typical open loop voltage gain of 20,000. Gain of up to 20 dB can be set without degrading the performance of the filter. The load impedance to ground (GRDA) at the amplifier output (GS_X) must be greater than 10 kilohms in parallel with less than 50 pF. The input signal on lead VF_X — can be either AC or DC coupled. The input op amp can only be used in the inverting mode as shown in Figure 3.

A low pass anti-aliasing section is included on-chip. This section typically provides 35 dB attenuation at the sampling frequency. No external components are required to provide the necessary anti-aliasing function for the switched capacitor section of the transmit filter.

The passband section provides flatness and stop-band attenuation which fulfills the AT&T D3/D4 channel bank transmission specification and CCITT recommendation G.712. The 29C16 and 29C17 specifications meet or exceed digital class 5 central office switching systems requirements. The transmit filter transfer characteristics and specifications will be within the limits shown in Figure 4.

A high pass section configuration was chosen to reject low frequency noise from 50 and 60 Hz power lines, 17 Hz European electric railroads, ringing frequencies and their harmonics, and other low frequency noise. Even though there is high rejection at these frequencies, the sharpness of the band edge gives low attenuation at 200 Hz. This feature allows the use of low-cost transformer hybrids without external components.

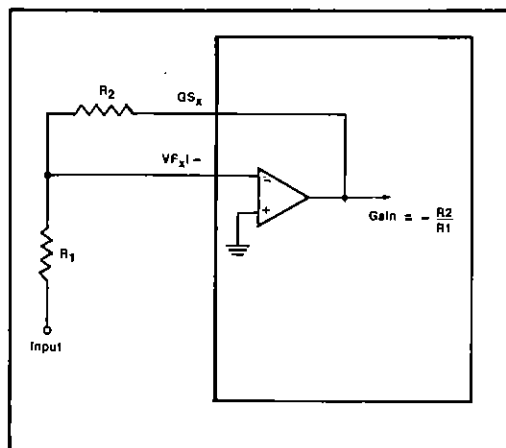

Figure 3. Transmit Filter Gain Adjustment

Encoding

The encoder internally samples the output of the transmit filter and holds each sample on an internal sample and hold capacitor. The encoder then performs an analog to digital conversion on a switched capacitor array. Digital data representing the sample is transmitted on the first eight data clock bits of the next frame.

An on-chip autozero circuit corrects for DC-offset on the input signal to the encoder. This autozero circuit uses the sign bit averaging technique; the sign bit from the encoder output is long term averaged and subtracted from the input to the encoder. In this way,

all DC offset is removed from the encoder input waveform.

RECEIVE OPERATION

Decoding

The PCM word at the D_R lead is serially fetched on the first eight data clock bits of the frame. A D/A conversion is performed on the digital word and the corresponding analog sample is held on an internal sample and hold capacitor. This sample is then transferred to the receive filter.

Receive Filter

The receive filter provides passband flatness and stopband rejection which fulfills both the AT&T D3/D4 specification and CCITT recommendation G.712. The filter contains the required compensation for the $(\sin x)/x$ response of such decoders. The receive filter characteristics and specifications will be within the limits shown in Figure 5.

Receive Output Power Amplifiers

A balanced output amplifier is provided in order to allow maximum flexibility in output configuration. Either of the two outputs can be used single ended (referenced to GRDA) to drive single ended loads. Alternatively, the differential output will drive a bridged load directly. The output stage is capable of driving loads as low as 300 ohms single ended or 600 ohms differentially.

Transmission levels are specified relative to the receive channel output under digital milliwatt conditions, that is, when the digital input at D_R is the eight-code sequence specified in CCITT recommendation G.711.

Table 4. Zero Transmission Level Points

Symbol	Parameter	Typ	Units	Test Conditions
OTLP1 _x	Zero Transmission Level Point Transmit Channel (0dBm0) μ -law	+2.76 +1.00	dBm dBm	Referenced to 600 Ω Referenced to 900 Ω
OTLP2 _x	Zero Transmission Level Point Transmit Channel (0dBm0) A-law	+2.79 +1.03	dBm dBm	Referenced to 600 Ω Referenced to 900 Ω
OTLP1 _R	Zero Transmission Level Point Receive Channel (0dBm0) μ -law	+5.76 +4.00	dBm dBm	Referenced to 600 Ω Referenced to 900 Ω
OTLP2 _R	Zero Transmission Level Point Receive Channel (0dBm0) A-law	+5.79 +4.03	dBm dBm	Referenced to 600 Ω Referenced to 900 Ω

ABSOLUTE MAXIMUM RATINGS

Temperature Under Bias	-10°C to +80°C
Storage Temperature	-65°C to +150°C
V _{CC} and GRDD with Respect to V _{BB}	-0.3V to 15V
All Input and Output Voltages	
with Respect to V _{BB}	-0.3V to 15V
All Input and Output Voltages	
with Respect to V _{CC}	-15V to +0.3V
Power Dissipation	1.35W

***NOTICE:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

D.C. CHARACTERISTICS

(T_A = 0°C to 70°C, V_{CC} = +5V ± 5%, V_{BB} = -5V ± 5%, GRDA = 0V, GRDD = 0V, unless otherwise specified)

Typical values are for T_A = 25°C and nominal power supply values

DIGITAL INTERFACE

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
I _{IL}	Low Level Input Current			10	μA	GRDD ≤ V _{IN} ≤ V _{IL} (Note 1)
I _{IH}	High Level Input Current			10	μA	V _{IH} ≤ V _{IN} ≤ V _{CC}
V _{IL}	Input Low Voltage			0.8	V	
V _{IH}	Input High Voltage	2.0			V	
V _{OL}	Output Low Voltage			0.4	V	I _{OL} = 3.2 mA at D _x , \overline{TS}_x
V _{OH}	Output High Voltage	2.4			V	I _{OH} = 80 μA at D _x
C _{OX}	Digital Output Capacitance ²		5		pF	
C _{IN}	Digital Input Capacitance		5	10	pF	

POWER DISSIPATION

All measurements made at f_{DCLK} = 2.048 MHz, outputs unloaded.

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
I _{CC1}	V _{CC} Operating Current ⁴		6.8		mA	
I _{BB1}	V _{BB} Operating Current		7.2		mA	
I _{CC0}	V _{CC} Power Down Current		0.5		mA	PDN ≤ V _{IL} ; after 10μs

P _{D0}	Power Down Dissipation ³		5		mW	PDN ≤ V _{IL} ; after 10μs
P _{ST}	Standby Power Dissipation ³		8		mW	FS _x , FS _R ≤ V _{IL} ; after 300 ms

NOTES:

- V_{IN} is the voltage on any digital pin.
- Timing parameters are guaranteed based on a 100 pF load capacitance. Up to eight digital outputs may be connected to a common PCM high-way without buffering, assuming a board capacitance of 60 pF.
- With nominal power supply values.
- V_{CC} applied last or simultaneously with V_{BB}.

ANALOG INTERFACE, TRANSMIT CHANNEL INPUT STAGE

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
I_{BX1}	Input Leakage Current, $V_{FX1} -$			100	nA	$-2.17V \leq V_{BX} \leq 2.17V$

A.C. CHARACTERISTICS — TRANSMISSION PARAMETERS

Unless otherwise noted, the analog input is a 0 dBm0, 1020 Hz sine wave.¹ Input amplifier is set for unity gain, inverting. The digital input is a PCM bit stream generated by passing a 0 dBm0, 1020 Hz sine wave through an ideal encoder. Receive output is measured single ended. All output levels are $(\sin x)/x$ corrected. Typical values are for $T_A = 25^\circ\text{C}$ and nominal power supply values. ($T_A = 0^\circ\text{C}$ to $+70^\circ\text{C}$; $V_{CC} = +5V \pm 5\%$; $V_{BB} = -5V \pm 5\%$; $GRDA = 0$; $GRDD = 0$; unless otherwise specified).

GAIN AND DYNAMIC RANGE

Symbol	Parameter	Min	Typ	Max	Units	Test Conditions
EmW	Encoder Milliwatt Response (Transmit gain tolerance)	-0.18	± 0.04	+0.18	dBm0	Signal input of 1.064 Vrms μ -law Signal input of 1.068 Vrms A-law $T_A = 25^\circ\text{C}$; $V_{BB} = -5V$, $V_{CC} = +5V$
EmW _{TS}	EmW variation with Temperature and supplies	-0.07	± 0.02	+0.07	dB	$\pm 5\%$ supplies, 0 to 70°C Relative to nominal conditions
DmW	Digital Milliwatt Response (Receive gain tolerance)	-0.18	± 0.04	+0.18	dBm0	Measure relative to OTLP _R . Signal input per CCITT Recommendation G.711. Output signal of 1000 Hz. $R_L = \infty$ $T_A = 25^\circ\text{C}$; $V_{BB} = -5V$, $V_{CC} = +5V$.
DmW _{TS}	DmW variation with temperature and supplies	-0.07	± 0.02	+0.07	dB	$\pm 5\%$ supplies, 0 to 70°C

NOTES:

1. 0dBm0 is defined as the zero reference point of the channel for μ law under test (OTLP). This corresponds to an analog signal input of 1.064 volts rms or an output of 1.503 volts rms.

	3400 Hz	-0.7		-0.1	dB	
	4000 Hz			-14	dB	
	4600 Hz and Above			-30	dB	

Figure 5. Receive Channel

A.C. CHARACTERISTICS — TIMING PARAMETERS**CLOCK SECTION**

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{CY}	Clock Period, CLK	488			ns	$f_{CLK} = 2.048 \text{ MHz}$
t_{CLK}	Clock Pulse Width, CLK	220			ns	
t_{DCLK}	Data Clock Pulse Width	220			ns	$64 \text{ kHz} \leq f_{DCLK} \leq 2.048 \text{ MHz}$
t_{CDC}	Clock Duty Cycle, CLK	45	50	55	%	
t_r, t_f	Clock Rise and Fall Time	5		30	ns	

TRANSMIT SECTION, FIXED DATA RATE MODE¹

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{DZX}	Data Enabled on TS Entry	0		145	ns	$0 < C_{LOAD} < 100 \text{ pF}$
t_{DDX}	Data Delay from CLK	0		145	ns	$0 < C_{LOAD} < 100 \text{ pF}$
t_{HZX}	Data Float on TS Exit	60		215	ns	$C_{LOAD} = 0$
t_{SON}	Timeslot X to Enable	0		145	ns	$0 < C_{LOAD} < 100 \text{ pF}$
t_{SOFF}	Timeslot X to Disable	60		190	ns	$C_{LOAD} = 0$
t_{FSD}	Frame Sync Delay	100		$t_{CY} - 100$	ns	

RECEIVE SECTION, FIXED DATA RATE MODE

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{DSR}	Receive Data Setup	10			ns	
t_{DHR}	Receive Data Hold	60			ns	
t_{FSD}	Frame Sync Delay	100		$t_{CY} - 100$	ns	

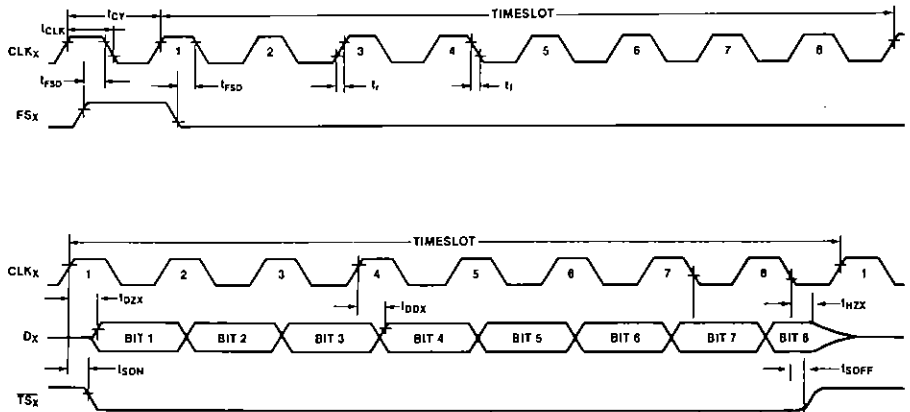

NOTES:

1. Timing parameters t_{DZX} , t_{HZX} , and t_{SOFF} are referenced to a high impedance state.

WAVEFORMS

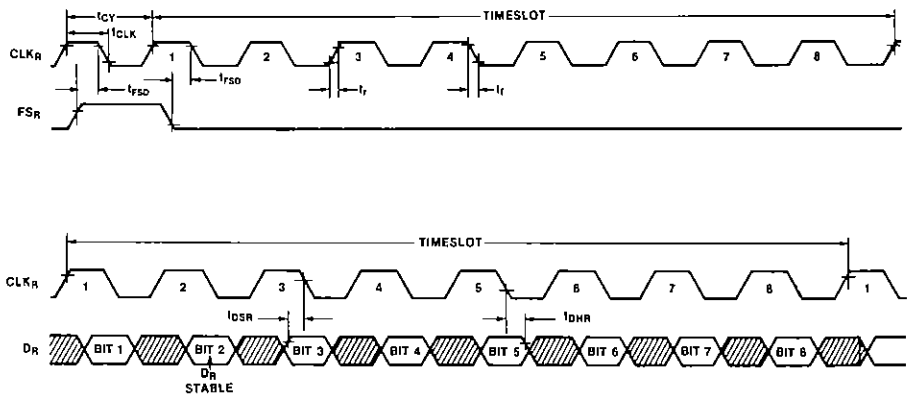

Fixed Data Rate Timing

TRANSMIT TIMING

NOTE: ALL TIMING PARAMETERS REFERENCED TO V_{IH} AND V_{IL} EXCEPT t_{DZX} , t_{SOFF} AND t_{HZX} WHICH REFERENCE A HIGH IMPEDANCE STATE

RECEIVE TIMING

NOTE: ALL TIMING PARAMETERS REFERENCED TO V_{IH} AND V_{IL} .

TRANSMIT SECTION, VARIABLE DATA RATE MODE¹

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{TSDX}	Timeslot Delay from $DCLK_X^2$	140		$t_{DX} - 140$	ns	
t_{FSD}	Frame Sync Delay	100		$t_{CY} - 100$	ns	
t_{DDX}	Data Delay from $DCLK_X$	0		100	ns	$0 < C_{LOAD} < 100$ pF
t_{DON}	Timeslot to D_X Active	0		50	ns	$0 < C_{LOAD} < 100$ pF
t_{DOFF}	Timeslot to D_X Inactive	0		80	ns	$0 < C_{LOAD} < 100$ pF
t_{DX}	Data Clock Period	488		1562	ns	
t_{DFSX}	Data Delay from FS_X	0		140	ns	

RECEIVE SECTION, VARIABLE DATA RATE MODE

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{TSDR}	Timeslot Delay from $DCLK_R^3$	140		$t_{DR} - 140$	ns	
t_{FSD}	Frame Sync Delay	100		$t_{CY} - 100$	ns	
t_{DSR}	Data Setup Time	10			ns	
t_{DHR}	Data Hold Time	60			ns	
t_{DR}	Data Clock Period	488		1562	ns	
t_{SER}	Timeslot End Receive Time	0			ns	

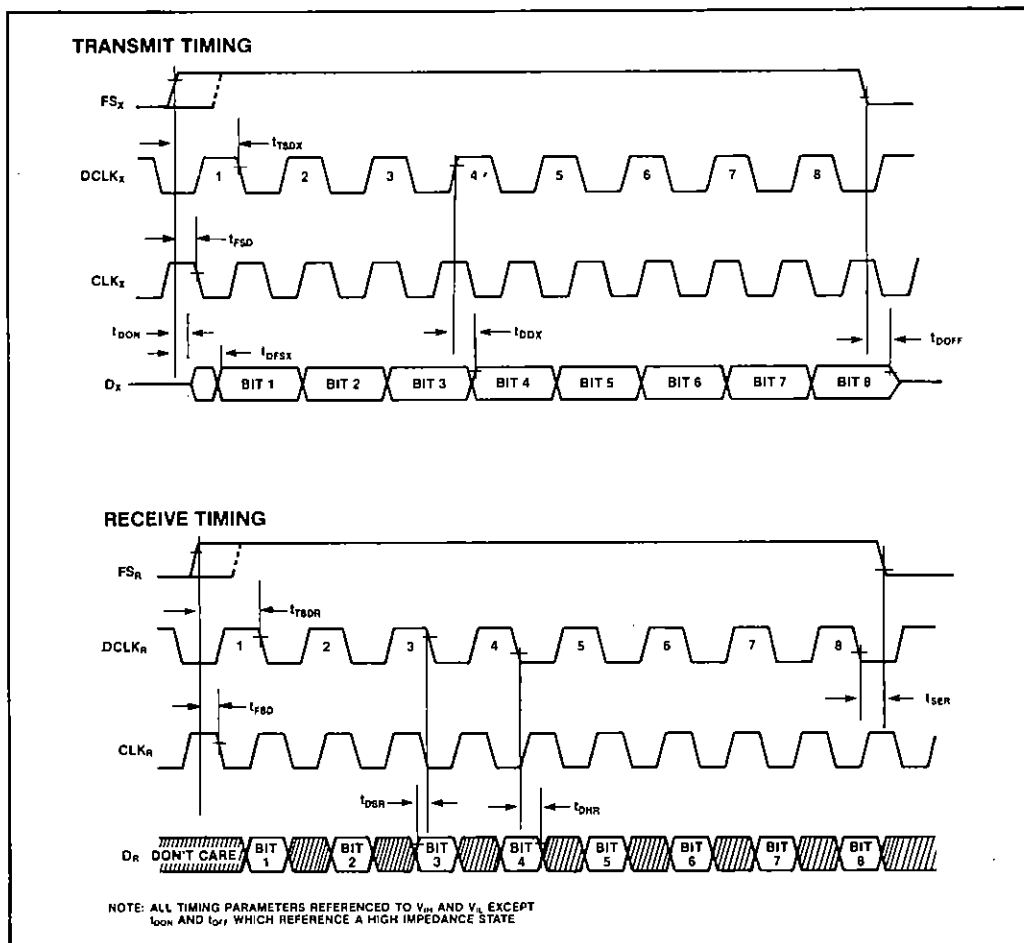

64 KB OPERATION, VARIABLE DATA RATE MODE

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
t_{FSLX}	Transmit Frame Sync Minimum Downtime	488			ns	FS_X is TTL high for remainder of frame
t_{FSLR}	Receive Frame Sync Minimum Downtime	1952			ns	FS_R is TTL high for remainder of frame
t_{DCLK}	Data Clock Pulse Width			10	μ s	

NOTES:

- Timing parameters t_{DON} and t_{DOFF} are referenced to a high impedance state.
- t_{FSLX} minimum requirements overrides t_{TSDX} maximum spec for 64 kHz operation.
- t_{FSLR} minimum requirements overrides t_{TSDR} maximum spec for 64 kHz operation.

VARIABLE DATA RATE TIMING
